

“BROWN PATCHES ARE ALL OVER MY LAWN!” exclaims a frustrated homeowner

If you have these troublesome brown patches on your property that have gotten increasingly worse with time, you may well have a Japanese beetle grub infestation in your lawn. While chemical options are available, there is a safe, effective remedy in using Milky Spore.

We’re all familiar with the damage the adult Japanese beetle does as it feasts on fruit, flower, shrubs, garden plants and the foliage of some field crops. At the immature beetle stage, the grub enjoys feeding on the roots of grass and other vegetation to include stems of plants. Applications with Milky Spore attack the beetle at the grub level BEFORE damage is done. Milky Spore acts as an on-guard protective blanket on your lawn and works for at least 10 years.

Milky Spore is safe as opposed to the many dangerous chemical applications. Milky Spore is not harmful to beneficial insects, birds, bees, pets or man. The product is approved and registered with EPA; Milky Spore will not affect wells, ponds or streams. The ideal way to combat area infestation is through organized community efforts. Large areas treated with Milky Spore can result in long term control.

Blade Runners issues a Milky Spore certificate for properties and communities that use this product on their turf area that can be used for future home sales or in community newsletters.

Milky Spore has gone through many transformations. The product that Blade Runners uses is the original formula devised by the USDA, produced by St Gabriel Laboratories, that has been proven effective for over 70 years to limit Japanese Beetle grub infestations. Milky Spore is effective, innovative and on the cutting edge of environmental friendly products.
